

Fall Prevention Kit

Safety Commitment.

It's what makes us different.

The lift pit fall prevention kit is required to ensure safe entry and exit to deep lift pits for lift technicians.

Safety

The fall prevention kit is complete with a retractable lanyard, hitch point and boat hook which allow the technician to safely connect the lanyard to a full body harness whilst entering and exiting the lift pit.

This kit will prevent the risk of falling from the pit ladder or landing when conducting maintenance or repairs in the lift pit.

Requirements

Workplace OH&S legislation stipulates that the use of a harness or fall restraint kit must be used when working at heights of 2 meters or greater.

Schindler Lift Technicians are required to enter the lift pit regularly during routine maintenance and repair work.

It is important that safe and efficient access and exiting of the lift pit is possible to ensure minimum down time of the equipment.

Benefits

Availability of adequate fall prevention ensures the owner's requirements under the workplace health and safety act are met.

Minimises downtime of equipment during routine maintenance.
